

# Etibreak range

## ETIBREAK 2 MOULDED CASE CIRCUIT BREAKERS

Rated current ( $I_n$ ) from 20A to 1600A. Breaking Capacity ( $I_{cu}$ ) from 25kA to 125kA at 400/415V AC.

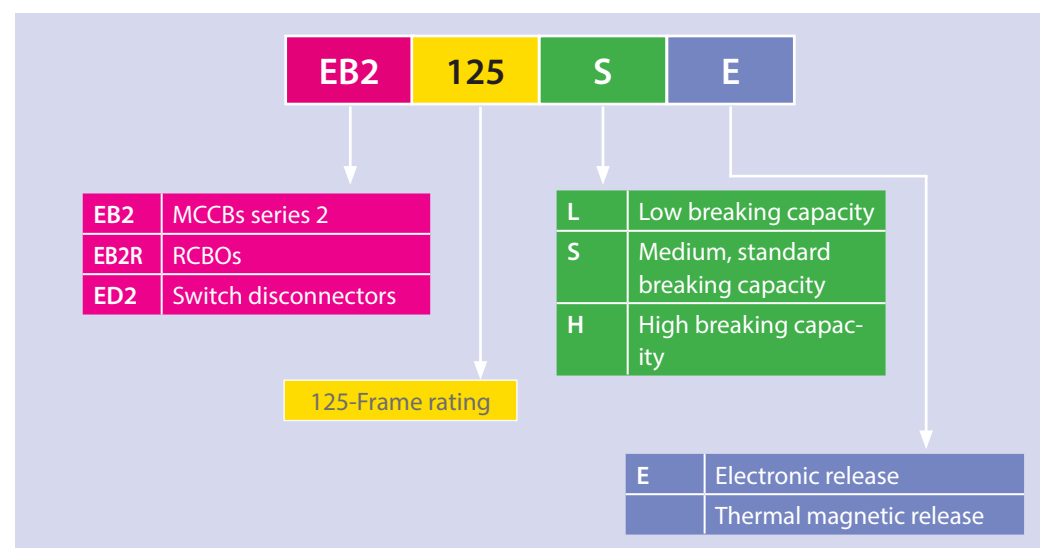

## Easy selection guide

### The Etibreak range of products includes:

- Moulded Case Circuit Breakers (MCCBs)
- Switch-Disconnectors in the same compact moulded case frame sizes as MCCBs
- Low voltage MCCBs with residual current protection EB2R up to 250AF.
- A comprehensive range of accessories which are common to MCCBs and Switch-Disconnectors. Almost all internal accessories for EB2 are common to all sizes.

### Key to Model and Type Designations

\*All Etibreak 2 MCCBs limit short-circuit faults by opening in less than 5ms.

# Advantages

## 1. Field-installable accessories

- Most accessories can be fitted by the switchboard builder or added by the end-user.
- Handles and motor operators up to 250AF size can be rapidly fitted using the locking pegs. It takes less than 10 seconds to secure a handle or motor to the MCCB – a great time saving compared to alternative products.
- All accessories are endurance tested to the same level as the host MCCB.

## 2. Superior temperature performance

Overheating is the most common cause of failure in electrical switchgear. You can reduce the likelihood of overheating by using switchgear with superior temperature performance.

Our EB2 MCCBs can be used at 50 °C without derating from 20A to 1600A.

## 3. Direct Opening

Under the heading “Measures to minimise the risk in the event of failure”, IEC 60204-1 Safety of Machinery- Electrical Equipment of Machinery includes the following recommendation:  
 “-the use of switching devices having positive (or direct) opening operation.”

## 4. Unsurpassed Flexibility

Overload protection is adjustable between 63% and 100% of the rating. Short-circuit protection is adjustable on all thermal magnetic models. Short-circuit protection settings are suitable for motor starting on all models, including the compact 125A frame.

## 5. Visual safety

Coloured indicators display the ON or OFF status. The indicators are fully covered if the breaker trips, and black is the only visible colour.

# Advantages

## 6. Safety lock for plug-in version

The plug in MCCB is locked to the base when toggle is ON. It cannot be removed unless the toggle is OFF or TRIPPED. The safety lock prevents a trip occurring while the MCCB is being removed from the base. Safety lock is available on plug-in MCCBs up to 800A.

## 7. Smaller 1000A MCCB

The new 1000A MCCB is only 213mm high by 210mm wide - the same size as an 800A MCCB. This offers a cost-effective and space effective solution for large loads.

## 8. Compact interlocks

The mechanical interlock is installed on the front of the MCCB, and fits underneath motor operators and external operating handles. An automatic change-over system can be assembled in a few minutes by a switchboard builder or end-user. Compact interlocks are available on MCCBs up to 800A.

## 9. Circuit breaker with integral residual current protection (EB2R)

ETI EB2Rs deliver integrated protection from earth leakage faults, overloads and short-circuits in one device. Ideal for mining industry, temporary site suppliers, heavy industry and commercial building use.

## 10. New 75mm wide MCCB up to 160A, 40kA

Save space and save money with our ETIBREAK EB2S up to 160A

# Some more advantages

## Safety plus

### Machine Safety

Etibreak MCCBs are marked with IEC symbol indicating Direct Opening Action. (D)

EB2 MCCBs help you to comply with the world's most stringent safety standards. It is one of the safest switching devices for machinery.

The robust mechanism ensures that the force you apply to the toggle is transmitted directly to the contacts.

Under the heading "Measures to minimise risk in the event of failure", IEC 60204-1 Safety of Machinery - Electrical Equipment of Machines includes the following recommendation:

" - the use of switching devices having positive (or direct) opening operation."

### Visual Safety

You can easily see if a breaker is open, closed or tripped. **SAFETY+** coloured indicators boldly display the ON or OFF status. The indicators are fully covered if a breaker trips, and black is the only visible colour. This is a unique safety feature. You can identify faulty circuits at a glance. The toggle position always matches the position of the main contacts.

# Some more advantages

## Touch Safety

The risk of touching live parts has been minimised by design. These features reduce the risk of touching live parts:

- There are no exposed metal screws on the front face
- IP20 protection at the terminals
- IP30 protection at the toggle
- If the toggle is broken by accident or misuse, no live part is exposed
- No live parts are exposed when fitting accessories
- Double Insulation

## Reducing Environmental Impact

### Longer Life Cycle

It makes good environmental sense to install a product with a long life expectancy. If you install an Etibreak 2 MCCB, you can expect it to stay in service for at least 30,000 mechanical operations (250A Frame). This is 22,000 more operations than recommended by IEC 60947-2, the international standard for circuit breakers. If a system must be upgraded in future, we have made the following provisions for recycling:

- 1 The modular design of Etibreak 2 allows component parts and accessories to be easily disassembled and separately disposed of. Moulded parts do not contain any embedded metal parts.
- 2 Materials are clearly marked to allow future identification for easy recycling.

### Uses Eco-friendly Materials

The following materials are used in most Etibreak 2 circuit breakers:

- Thermoplastic resin not containing PBBs or PBDEs
- Lead-free solder
- Cadmium-free contacts

### Lighter and Smaller

Components with low weight and volume make life easy for users, but high performance from smaller products also means less material used and less waste produced.

2

#### Standards

IEC 60947-1, IEC 60947-2, IEC 60947-3 (for ED2), IEC 60947-5-1 (for Accessories), IEC 60204-1 (Safety of Machinery), NEMA AB1, JIS C 8201-2-1 Ann.1

# Etibreak

## Moulded Case Circuit Breaker Etibreak EB2

**Thermal magnetic**

Thermal magnetic MCCBs are available in frame sizes from 125A to 800A. All frame sizes have adjustable both thermal and magnetic trip settings. Overload protection is adjustable between 63 % and 100 % of  $I_n$ , meanwhile short-circuit between 6-13x $I_n$  (more details in the technical part of catalogue).

### Microprocessor's MCCBs

Microprocessor's MCCBs are available in frame sizes from 250 A up to 1600 A, with rated current from 40 A up to 1600 A. All frame sizes have adjustable thermal and magnetic protection.

Series 2: Protection against overload can be adjusted between 0,4 – 1 x  $I_n$ , meanwhile short-circuit protection has already preset different curves, which can be easily selected according to the type of load.

#### Optional Functions:

- A - Standard relay with LSI Characteristic (where no letters are present then MCCB is A type)
- P - Preferential Trip Alarm
- G - Ground Fault

- N - Neutral Protection
- S - Phase rotation function
- C - Communication function
- W - Electrical energy pulse
- H - Harmonic current

All internal and external accessories for MCCBs can also be mounted to corresponding type of switch disconnectors.

ED2 1250/3 PI 3C:

This is an already prepared Plug-in version for ED2 with 3 AUX terminals on conversion side. Beside that you have to order base side (NPF) and AUX terminals for base side (please see accessories for 1250AF)

## Low voltage moulded case circuit breakers with residual current protection

Main advantages:

- Combined protection against overloads, short circuits and earth leakage integrated in one device
- The new EB2R save the space
- The EB2R has the same dimensions and fixing as the EB2 MCCBs
- The EB2R eliminates the need for either an external relay with current transformers or add-on block
- Residual current is adjustable
- Earth leakage protection time delay is adjustable
- Wide range of accessories (as MCCB – only shunt/undervoltage trip units can not be fitted to EB2R)

Residual current monitor and pre trip module (optional)

- normally open alarm contact (2A, 250V AC) closes on detection of residual current. Alarm threshold is adjustable.
- Green LED indicates voltage is present
- Red LED provides visual indications of residual current.
- Can be configured to provide trip + alarm or alarm only.
- Remote trip terminals allow tripping by push-button
- Can be configured to provide voltage drop protection.

Plug-in Conversion 4-p, NPI 400-630AF - 630A 4p	004671488	4p	1
Extension terminal for fixed Plug-in 3-p, SK3 400-630	004671470	3p	set = 3 pcs
Extension terminal for fixed Plug-in 4-p, SK4 400-630	004671471	4p	set = 4 pcs

- at 630A plug-in Conversion is max Rated current 504A at 50°C and 535,5A at 30°C and 40°C

- basic configuration: fixed plug-in + plug-in conversion

- extension terminals is used when fixed part of plug-in is under mounting plate - not used for basic configuration

- if additional accessories are installed in MCCB, plugs and sockets (PSPSS, PSHUV and PIO) are required,

ZB2 Straight

# Ratings and Specifications

## Thermal magnetic adjustments and characteristics

### Thermal adjustment

Low voltage moulded case circuit breakers have a wide thermal adjustment range, one of the largest on the market. The rated current ' $I_r$ ' is continuously adjustable from 63% to 100% of this nominal current ' $I_n$ '. There are three main points of calibration marked at 63%, 80% and 100%.

### Magnetic adjustment

An adjustable magnetic characteristics allows short-circuit protection to be matched to the load and supply characteristics, for example motor inrush current or generator short-circuit current.

# Characteristics

## Thermal Magnetic Protection

Etibreak MCCBs from 125A frame to 800A frame are available with thermal magnetic protection units. All 3 pole and 4 pole models have adjustable thermal and adjustable magnetic characteristics.

3 Pole MCCB with Adjustable Thermal and Adjustable Magnetic Characteristics

An adjustable magnetic characteristic allows short-circuit protection to be matched to the load and supply characteristics, for example motor inrush current or generator short-circuit current.

Lowering the short-circuit tripping threshold can allow a higher earth-loop impedance in an installation and provide end-of-cable protection with correct disconnection times.

### Adjustment Dials

- $I_R$  is the thermal element adjustment dial and is used to set the rated current to match the conductor rating.  $I_R$  can be set between 0.63 and 1.0 times  $I_n$ .
- $I_i$  is the magnetic element adjustment dial and is used to set the short circuit tripping threshold to suit the application.  $I_i$  can be set between 6 and 12 times  $I_n$  on 125A and 400A frame models.  $I_i$  can be set between 5 and 13 times  $I_n$ , depending on the frame size and rated current (please see tables in commercial data).

# Characteristics

## Microprocessor (Electronic) Protection

Etibreak 2 MCCBs from 250A frame to 1600A frame are available with electronic protection units. Current ratings,  $I_n$ , of 40A, 125A, 160A, 250A, 400A, 630A, 800A, 1000A, 1250A and 1600A are available. These offer great flexibility as their characteristics can be set to suit a wide range of application conditions. Overload protection can be set between 0.4 and 1.0 times  $I_n$ .

ETI offers one of the most adaptable protection units on the market:

Selecting a Preset Characteristic for a 400A Etibreak MCCB with Electronic Protection

Every Etibreak electronic protection unit includes overload protection (L), delayed short-circuit protection (S) and instantaneous protection (I) as standard.

Electronic Protection Characteristic

## Optional Functions

Neutral protection (N) is present if this box is filled

Ground fault trip (G) is present if this box is filled

Preferential trip (P) alarm is present if this box is filled

DIP switch to enable/ground fault trip

Three optional functions are available:

### Ground Fault Trip (G)

This function trips the MCCB after time delay,  $t_g$ , if the ground fault current exceeds the preset threshold,  $I_g$ . Ground fault protection can be enabled and disabled by operating a DIP switch on the electronic protection unit. An external current transformer is available if the ground fault trip function is required on a 3 pole MCCB, in a 3 phase, 4 wire system. The ground fault trip function is available from 400A to 1600A.

### Neutral Protection (N)

Neutral protection trips the MCCB after time delay,  $t_N$ , if current in the neutral conductor exceeds the rated current,  $I_n$ , of the MCCB. The time delay characteristic is identical to that of the overload characteristic (L).

### Preferential Trip Alarm (P)

An LED and volt-free output contact are activated after a time delay,  $t_p$ , if the load current exceeds the preset threshold,  $I_p$ . An OCR power supply is required for operation of the preferential trip alarm. This is mounted as shown below, either on the side of the breaker (250A to 1600A – standard), or remotely (400 to 1600A only – on request). Ratings, specifications and wiring arrangements are shown on the next page. Note that the breaker mounted terminal block is not compatible with the OCR power supply for Front-Connected and Rear-Connected MCCBs, if the OCR power supply is mounted on the right side of the breaker.

# Characteristics

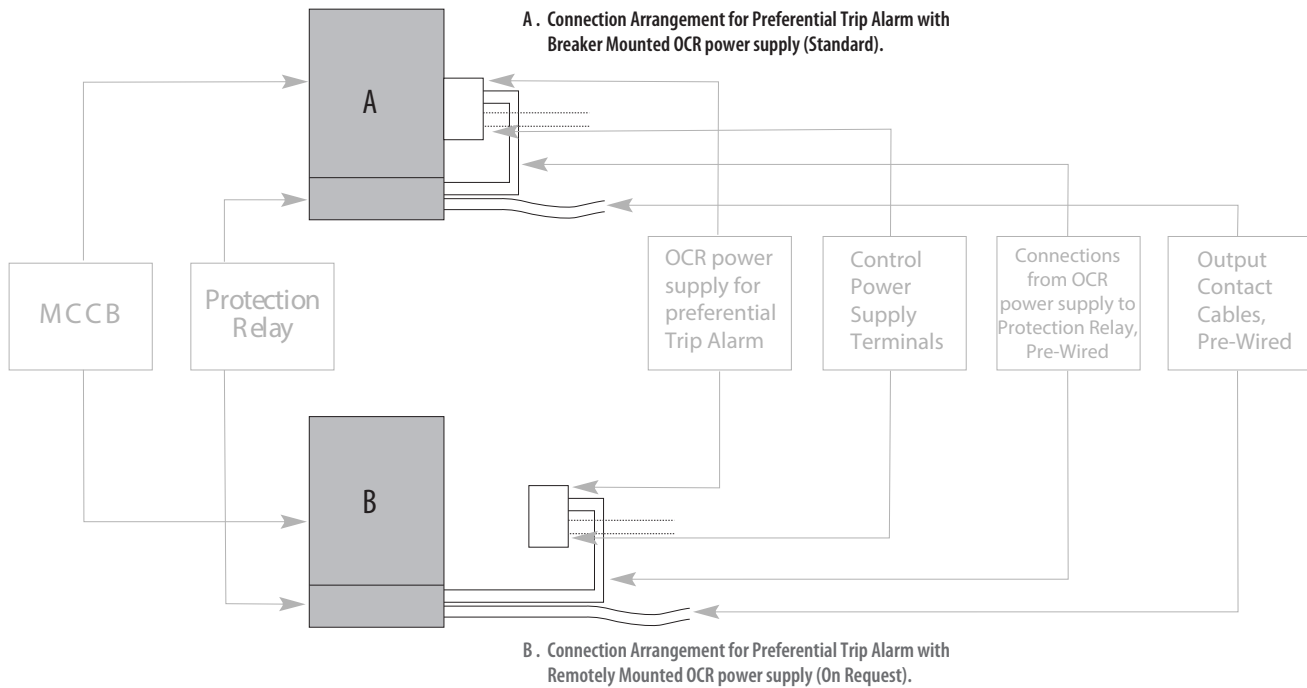

## Microprocessor (Electronic) Protection

### OCR Power Supply Specifications

Voltage	200-240V AC
Rated Power	2VA

### Rated Current of Output Contact

	resistive load	inductive load
250V AC	2A	2A
220V DC	2A	2A

### How to Specify Optional Functions

Optional functions must be specified at the time of order. Descriptions for electronic MCCBs include a 1-4 digit alphabetic code after the type designation which details the combination of optional functions. For example:

S400-GE APG 3P 400A FC - includes preferential trip and ground fault trip.

The table below lists codes for all the optional functions currently available:

Optional Functions					
I <sub>n</sub>	Poles	Code	Ground Fault (G)	Neutral Protection (N)	Preferential Trip Alarm (P)
250	3	AP	-	-	■
		AP	-	-	■
	4	AN	-	■	-
		APN	-	■	■
400	3	AP	-	-	■
		AG	■	-	-
		APG	■	-	■
630	4	AP	-	-	■
		AN	-	■	-
		APN	-	■	■
		AGN	■	■	-
		APGN	■	■	■

# Characteristics

## Microprocessor (Electronic) Protection

### Adjustment Dials

The left adjustment dial sets the rated current to match the conductor rating. The right adjustment dials select one of six on 630A models preset characteristics. The effects of the left adjustment dial (labelled  $I_R(A)$ ), and the right adjustment dial (labelled Characteristics) are detailed in the tables shown underneath each time/current graph.

### Tolerances of Characteristics

Characteristics		Tolerance
Long Time Delay	$I_R$	Tripping when $(I_R \times 1,05) < \text{load current} \leq (I_R \times 1,25)$
	$t_R$	$\pm 20\%$
Short Time Delay	$I_{sd}$	$\pm 15\%$
	$t_{sd}$	Total clearing time +50ms, resettable time -20ms
Instantaneous	$I_i$	$\pm 20\%$
Preferential Trip Alarm	$I_p$	$\pm 10\%$
	$t_p$	$\pm 10\%$
Ground Fault Trip	$I_g$	$\pm 15\%$
	$t_g$	Total clearing time +50ms, resettable time -20ms
Neutral Protection	$I_N$	Tripping when $(I_N \times 1,05) < \text{load current} \leq (I_N \times 1,3)$

# Characteristics

## Electronic protection with measurement and data communication

### Appearance

The Etibreak EB2 enhanced electronic breaker with integrated VT and CT monitors the current, voltage, instantaneous electrical power, integrated electrical energy and power factor of a circuit.

This breaker using the Modbus protocol allows data such as measured values and event/fault logs to be transmitted to an external device.

- 250A frame models have measurements and data communication options but no LCD window.
- Models of 400A frame and above have an LCD window. The LCD window provides the phase currents, line voltages (and their maximum values), power factor, electrical power and electrical energy. It can also provide the 1st to 19th harmonic currents for each phase.
- When a fault occurs, the cause of the fault and the fault current are indicated on the LCD. Data in memory is stored even if the power is lost. You can view event or fault logs after the power is restored.
- Models of 400A frame and above are available in three LCD orientations corresponding to the installation orientations of the breaker.

Vertical (move the handle up to ON) (Standard orientation)	Horizontal (move the handle right to ON)	Horizontal (move the handle left to ON)

If the breaker is installed in a horizontal orientation, please specify “Horizontal (move the handle right to ON)” or “Horizontal (move the handle left to ON)” when ordering. Otherwise the standard orientation “Vertical (move the handle up to ON)” will apply.

### OCR Power Supply for Electronic Protection with Measurement and data Communication

The XOW OCR, protection relays, requires control power.

The OCR power supply is installed on the right side of the breaker as standard.

This can also be installed separately to the breaker. Please specify when ordering.

#### Specifications of OCR power supply (XOW -1)

- The permissible range of the control voltage is 85 to 110% of the rated voltage. Please specify the rated voltage when ordering.
- When the OCR power supply is installed on the right side of the breaker, the breaker cannot be equipped with a terminal block for connection to the shunt trip device and under voltage trip device.
- XOW-2 requires a 24V DC (2W) supply.

The LCD window is equal to the handle frame in width; the panel cutout can be made easily.

Control voltage (Rated voltage)	100 – 120 VAC or 200 – 240 VAC
Current consumption	2VA

# Characteristics

## Residual (earth leakage) current protection

RCBO Test Button, Trip Indicator, Power LED and Adjustment Dial

3-Pole RCBO with Adjustable Settings

Circuit Breakers with Integral Residual Current Protection (RCBOs) are the ultimate safeguards against the hazards of earth leakage.

The EB2 RCBO range is available in 2 frame sizes, 125A and 250A. Interrupting capacities of 25kA, 36kA and 65kA are offered in 3 and 4 poles versions with adjustable thermal and fixed magnetic protection characteristics. RCBO residual current protection settings are shown on the following page.

### Residual Current Monitor and Pre Trip Module (Optional)

- Normally open alarm contact (2A, 250V AC) closes on detection of residual current. Alarm threshold is adjustable.
- Green LED indicates voltage is present.
- Red LED provides visual indications of residual current.
- Can be configured to provide trip + alarm or alarm only.
- Remote trip terminals allow tripping by pushbutton.
- Can be configured to provide voltage drop protection

# Characteristics

## Adjustment Dials

$I_{\Delta n}$  (A) is the adjustable tripping threshold for residual current (earth leakage) protection. It can be set between 30mA and 3A. Available settings are shown

below:  
 $\Delta t$  (ms) is a time delay which is introduced to the residual current (earth leakage) protection characteristic. Available settings are shown below. It can also be set to 0 (max. actual tripping time is 40ms) or NT (No Trip - tripping time =  $\infty$ ). The maximum breaking time at each setting is shown in brackets.

Note that if  $\Delta t$  is set at 30mA,  $\Delta t$  defaults to 0.  $I_R$  (A) is the adjustable tripping threshold for overload protection. It can be set between 0.63

and 1.0 times  $I_n$ . Available  $I_n$  ratings are shown below:  
 $I_i$  is the tripping threshold for short-circuit protection. It is fixed at the values shown below:

# Internal accessories

## Internal accessories - series 2 up to 1600AF

Electrical control accessories for EB2 are designed with the installer in mind. Status and alarm contacts, remote tripping coils and undervoltage protection coils are of modular design and convenient to use.

(1) (2) (3) (4) (5) (6)

- 1) Heavy-duty auxiliary switch
- 2) Heavy-duty alarm switch
- 3) General-purpose auxiliary switch
- 4) General-purpose alarm switch
- 5) Shunt trip
- 6) Undervoltage trip

- All auxiliary and alarm switches are common up to 1600A. Shunt trips and undervoltage trips are split between frame sizes (please see commercial part of the catalogue).
- All accessories are endurance tested to the same level as MCCBs.
- Etibreak 2 internal accessories are easily field-installable.
- All accessories are individually packaged and are supplied with fitting instructions.
- Control wiring is terminated on the accessory screw terminal. Alternatively a terminal block which clips to the side of the MCCB is available.

### Installing Accessories

The internal accessories can be easily installed in the field without special tools or product training.

### Easy field-Installation of Accessories

- Internal accessory can be simply plugged into position
- No tools are required for this, except a screwdriver to lift the MCCB front cover clips.
- Accessories fit with a firm click when installed correctly.
- Colour coding of accessories helps identification and installation Click

# Internal accessories

## Frame size (A)

125, 160, 250

400, 630

800, 1000

1250, 1600

- Status indication switches mount in the left side of the MCCB. General purpose and heavy duty status indication switches cannot be mixed in the same MCCB. Only one alarm switch can be fitted to an MCCB.
- Shunt trips and undervoltage trips mount in the right side of the MCCB.

- It is not possible to install a shunt trip and an undervoltage trip in an MCCB as they occupy the same location. Undervoltage trips can provide remote tripping if necessary by wiring a normally closed contact or pushbutton in series with the protected supply.
- Undervoltage trips with time delays require an external time delay controller which clips to the side of the MCCB.

# Internal accessories

## Status Indication Switches

General Purpose Auxiliary Switch

Terminal Designations and Function of General Purpose Auxiliary Switch

### General Purpose Auxiliary Switch (PS)

An auxiliary switch electrically indicates the ON or OFF status of the MCCB. The general purpose type is a changeover switch with 3 terminals.

Auxiliary switches are colour coded grey. The cable capacity of the terminals is 0.5 to 1.25mm<sup>2</sup>. The general purpose auxiliary switch meets the requirements of IEC 61058-1.

A microcurrent version is also available for switching currents as low as 1mA.

General Purpose Alarm Switch

Terminal Designations and Function of General Purpose Alarm Switch

### General Purpose Alarm Switch (SS)

An alarm switch electrically indicates the TRIP status of the MCCB. The general purpose type is a changeover switch with 3 terminals.

Alarm switches are colour coded grey and black. The cable capacity of the terminals is 0.5 to 1.25mm<sup>2</sup>. The general purpose alarm switch meets the requirements of IEC 61058-1.

A microcurrent version is also available for switching currents as low as 1mA

General purpose auxiliaries and alarm switch ratings						
Volts (V)	AC Amperes (A)		Volts (V)	DC Amperes (A)		Minimum Load
	Resistive Load	Inductive Load		Resistive Load	Inductive Load	
440	-	-	250	-	-	100mA at
240	3	2	125	0.4	0.05	15V DC.
110	3	2	30	3	2	

Microcurrent version		
Volts (V)	DC Amperes (A)	
	Resistive Load	Minimum Load
30	0.1	1mA at 5V DC and 30V DC

# Internal accessories

Heavy Duty Auxiliary Switch

Terminal Designations and Function of Heavy Duty Auxiliary Switch, NO contact

Terminal Designations and Function of Heavy Duty Auxiliary Switch, NC contact

## Heavy Duty Auxiliary Switch (PS)

The heavy duty auxiliary switch has an impulse withstand voltage ( $U_{imp}$ ) of 6kV and is suitable for isolating safety circuits. The auxiliary switch electrically indicates the ON or OFF status of the MCCB. The heavy duty type is a bridge switch with two terminals. It is available in either normally open or normally closed configurations.

Heavy duty auxiliary switches are colour coded grey. The cable capacity of the terminals is 1.25 to 2.5mm<sup>2</sup>. The heavy duty auxiliary switch meets the requirements of IEC 60947-5-1.

It has direct opening action, recommended by IEC 60204-1 Safety of Machinery - Electrical Equipment for Machines.

Heavy Duty Alarm Switch

Terminal Designations and Function of Heavy Duty Alarm Switch, NO contact

Terminal Designations and Function of Heavy Duty Alarm Switch, NC contact

## Heavy Duty Alarm Switch (SS)

The heavy duty alarm switch has an impulse withstand voltage ( $U_{imp}$ ) of 6kV and is suitable for isolating control circuits. The alarm switch electrically indicates the TRIP status of the MCCB. The heavy duty type is a bridge switch with two terminals. It is available in either normally open or normally closed configurations.

Heavy duty auxiliary switches are colour coded grey and black. The cable capacity of the terminals is 1.25 to 2.5mm<sup>2</sup>. The heavy duty alarm switch meets the requirements of IEC 60947-5-1. It has direct opening action, recommended by IEC 60204-1 Safety of Machinery - Electrical Equipment for Machines.

Ratings of Heavy Duty Auxiliary and Alarm Switches

48	6	6	24	6	2.5

# Internal accessories

## Remote Tripping Devices

Shunt Trips

Terminal Designations of Shunt Trips

### Shunt Trip (DA)

A shunt trip allows an MCCB to be tripped remotely on the application of the rated coil voltage across the shunt trip terminals. Etibreak 2 shunt trips have continuously rated coils and are suitable for use in electrical interlocking applications. The MCCB contacts and toggle will move to the tripped position when the shunt trip is operated.

The permissible voltage range is 85% to 110% for AC or 75% to 125% for DC. The cable capacity of the terminals is 0.5 to 1.25mm<sup>2</sup>. Shunt trips are colour coded grey.

Ratings of Shunt Trips						
Rated Voltage	Voltage AC		Voltage DC			
	200-240	380-450	24	48	100-120	200-240
Excitation Current (A)	0.014	0.0065	0.03	0.03	0.011	0.011

Undervoltage Trips

Terminal Designations of Undervoltage Trips

### Under Voltage Trip (UVT)

An undervoltage trip will trip the breaker automatically when the voltage applied to the terminals of the undervoltage coil drops to between 70% and 35% of its voltage rating. The undervoltage trip prevents the circuit breaker being closed unless a voltage corresponding to at least 85% of its voltage rating is applied across the terminals of the undervoltage coil. The MCCB contacts and toggle will move to the tripped position when the under-voltage trip operates.

Undervoltage trips with AC operating voltages are available with 500ms time delays. Time-delay units are fitted to the outside of MCCBs. The cable capacity of the terminals is 0.5 to 1.25mm<sup>2</sup>. Undervoltage trips are colour coded grey and black.

Ratings of Undervoltage Trips										
MCCB Model	Rated Voltage	Power supply capacity (VA)						Excitation current (mA)		
		Voltage AC			Voltage DC			24	100-120	200-240
125, 160, 250, 400 and 630AF		100-120	200-240	380-450	24	100-120	200-240	23	10	10
		1,4	2,8	2,3						
MCCB Model	Rated Voltage	Voltage AC						Voltage DC		
		100-110	115-120	200-220	230-240	380-415	440-450	24	100-120	200-240
800, 1000, 1250 and 1600AF		100-110	115-120	200-220	230-240	380-415	440-450	24	100-120	200-240

# Internal accessories

## Termination of Control Wiring

Terminal blocks are for optional use with all types of internally mounted accessory.

Terminal Block for Plug-in MCCBs

### Terminal Block for plug-in MCCBs

The terminal block for a plug-in MCCB consists of:

- a male section pre-fitted with 3 cables with which clips easily to the back of the MCCB
- a female section with 3 user terminals which clips easily into the plug-in base.

Up to 4 terminal blocks can be installed on a 125A, 160A or 250A frame MCCB. Up to 5 terminal blocks can be installed on a 400A or 800A frame MCCB.

1250A MCCBs utilise different terminal block arrangement from 800A model and below:  
2xPS+1xSS+1xUVT/SHT = 14 terminals used

Terminal Block for Front-Connected and Rear-Connected MCCBs

### Terminal Block for front-connected and rear-connected MCCBs

A terminal block facilitates convenient and accessible control wiring to internally mounted accessories. It allows the use of control wiring cables with larger cross-sectional area than permitted by the internal accessories themselves. This terminal block can be clipped to either side of the MCCB. If mounted on the left incoming wiring will be fed vertically up to the terminals. If mounted on the right, the incoming wiring will be fed vertically down to the terminals. Terminal blocks are pre-fitted with outgoing wiring which can be terminated directly on each internal accessory.

The maximum incoming cable size to the terminal block is 2.0mm<sup>2</sup>. Terminal blocks have 11 terminals.

# External accessories

## Electrical Control Using Motorised operation up to 1000A Overview – Motor Operators (MO)

Motor Operator for 125A and 250A Frame MCCB's

Motor Operator for 400A and 630A Frame MCCB's

Motor operators provide the possibility of opening and closing an MCCB on application of electrical control signals. ETIBREAK 2 motor operators are extremely reliable, having been designed to endure the same switching duty as the host MCCB.

- Easy field-installation.
- Fast operation ( $\leq 100\text{ms}$ ).
- Positive contact indication.
- Padlocking facility as standard (Maximum 3, hasp diameter 8mm).
- Optional keylock.
- Versions available with automatic reset function.
- Voltage presence indication.

Motor Operator for 125A and 250A frame MCCB's

Motor Operator for 400A and 630A frame MCCB's

Motor operators for 125A and 250A frame are mounted on the front of the breaker. They can be rapidly fitted by locating the round pegs and square pegs on the motor into corresponding round and square holes on the breaker. It takes less than 10 seconds to secure the motor to the MCCB. Two levers securely lock the motor into position. No tools are needed to fit the motor operator. 400A frame and 630A frame motor operators are held in place with mounting screws. They can be installed easily in the field.

# External accessories

## Electrical Control Using Motorised operation up to 1000A Indication of ON, OFF or TRIPPED Status

The handle of 125A and 250A frame motor operators has dual functions:

1. Indication of ON, OFF or TRIPPED status as shown in the photographs below;
2. Manual operation when handle is pulled out. The supply to electrical control circuits inside the motor operator is cut when the handle is pulled out.

MCCB on

MCCB off

MCCB tripped

Motor operators for 400A and 1000A frame MCCBs incorporate a mechanical flag which indicates the ON, OFF and TRIPPED status of the MCCB. They can be manually charged using the lever provided.

## Ratings and Specifications

Frame size of host MCCB (A)		125, 160, 250	400, 630	800
Rated operating voltage	200-220 V AC	■	■	■
	230-240 V AC	■	■	■
	24 V DC	■	■	■
	48 V DC	■	■	■

Operating time (s)	ON	0.1	0.1	0.1
	OFF	0.1	1.5	1.5
	RESET	0.1	1.5	1.5
Operating switch rating		100V, 0.1A, Opening voltage 44V, current 4mA	100V, 0.1A, Opening voltage 48V, current 1mA	
Power supply required		300VA minimum	300VA minimum	300VA minimum
Dielectric properties (1 min)		1500V AC (1000V AC for 24V DC and 48V DC motors)		
Weight		1.4kg	3.5kg	3.5kg

■ = Available

Note: Operating times shown in the above table apply only when the rated operational voltage is supplied to the motor operator. The voltage supplied to the motor operator must be within the range of 85% and 110% of the rated operating voltage.

# External accessories

## Electrical Control Using Motorised operation up to 1000A Motor Operator Control Circuits

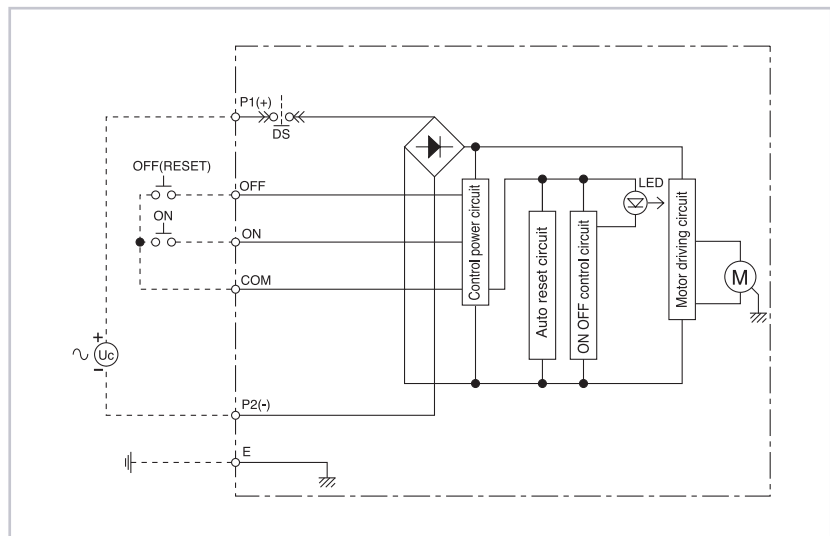

MCCB and Motor Operator Showing Control Wiring Socket

Control Wiring Plug

The Control circuits for Motor Operators are connected using a simple plug and socket system.

Control circuit for Motor Operators

### Operation

The motor operator incorporates a self-hold circuit for the closing and opening signals. Therefore a momentary open or close signal will ensure a complete operation. When the breaker trips, the breaker is reset by applying a signal to the OFF terminals of the motor. When a NA is used with a motor operator, design the control circuit so that the NA is energised before a reset or close signal is sent to the motor operator. A 40ms time delay in the reset and close signals is sufficient to allow the NA (undervoltage trip) to energise.

When a shunt trip is used with a motor operator, design the control circuit so that the shunt trip is de-energised before a reset or close signal is sent to the motor operator.

When a mechanical interlock is used with motor operators, design the control circuit to provide electrical interlocking between the motor operators. The electrical interlocking should prevent a close signal being sent to a motor operator unless the other motor operator and circuit breaker are in the OFF position.

### Auto- reset

Two types of motor operator are available: motor operators without auto-reset and motor operators with auto-reset. The correct type of motor operator should be selected for the application. MCCB auxiliary and alarm switches do not have to be used in the control circuits for motor operators whether they have auto-reset or not, saving cost and space.

# External accessories

## Electrical Control Using Motorised Operation 1250A and 1600A

- Positive Contact indication  
Colour coding indicates the true position of the contacts clearly: ON (red), OFF (green), TRIP (white).

- Easy Maintenance  
Breaker mounting, removal, and even setting changes can be done without removing the motor operator

Manual ON/OFF Operation with One Stroke

- Fast Closing Operation  
Closing in 60ms or less. The closing time remains constant over repeated operations.

### Ratings and Specifications

Frame size of host MCCB (A)		1250 & 1600A	
Rated operating voltage	AC	100-115V; 50/60Hz	■
		200-230V; 50/60Hz	■

## Electrical Control Using Motorised Operation 1250A and 1600A

### Motorised Operation

#### ON CONTROL

When the ON switch is closed, the latch release coil (LRC) is excited and the closing spring is released. The breaker quickly closes and goes into ON status. When the closing spring is released, the limit switch (LS) is opened and the LRC is de-excited.

#### OFF CONTROL

When the off switch is closed, self-hold control relay (Y) is activated and motor (M) operates to charge the closing spring. The breaker changes to OFF status.

#### RESET CONTROL

When the breaker is in TRIP status, closing the OFF switch activates self-hold control relay (Y) and starts motor (M). Motor (M) charges the closing spring and resets the breaker.

### Manual Operation

#### ON, OFF (RESET)

The breaker can be opened (OFF or RESET) and closed (ON) alternately by pulling the operating lever down in one full stroke. ON/OFF operation of the breaker is possible without charging or releasing the closing spring.

#### EMERGENCY TRIP

Opening the breaker (OFF) using the motor operator takes up to 3 seconds. If a remote emergency OFF function is necessary, incorporate the shunt trip device (SHT) or the undervoltage trip device (UVT) into the breaker.

#### PRECAUTIONS REGARDING USAGE

- If using the UVT option, be sure to reset the UVT before closing the breaker
- The motor operator must be supplied with voltage within the following range:  
DC: 75-110% of rated voltage  
AC: 85-100% of rated voltage  
Operation at low voltage may burn out the motor

### Anti-pumping Function

When the breaker is turned ON and the closing spring is released, self-hold control relay X is active. Xa-contact is held closed, and Xb-contact is opened. While the ON switch is closed, latch release coil (LRC) will not be excited even if the OFF switch is closed or an automatic reset circuit is being used. Pumping is thus prevented.

### Automatic Charge/ discharge Function

If the breaker is closed manually (ON) while the power source is on, the handle switch (HS) induces automatic release of the closing spring. Likewise, if the breaker is opened manually (OFF), the springs are automatically charged. If the breaker is opened or closed while the power source is off, later when the power source is turned on, the closing spring will automatically be charged or discharged to match the ON/OFF status of the breaker. This automatic charge/discharge function is necessary to prepare the closing mechanism for the next ON/OFF operation. The sound of the charging or discharging of the spring should not be mistaken for a malfunction.

# External accessories

## Electrical Control Using Motorised Operation 1250A and 1600A

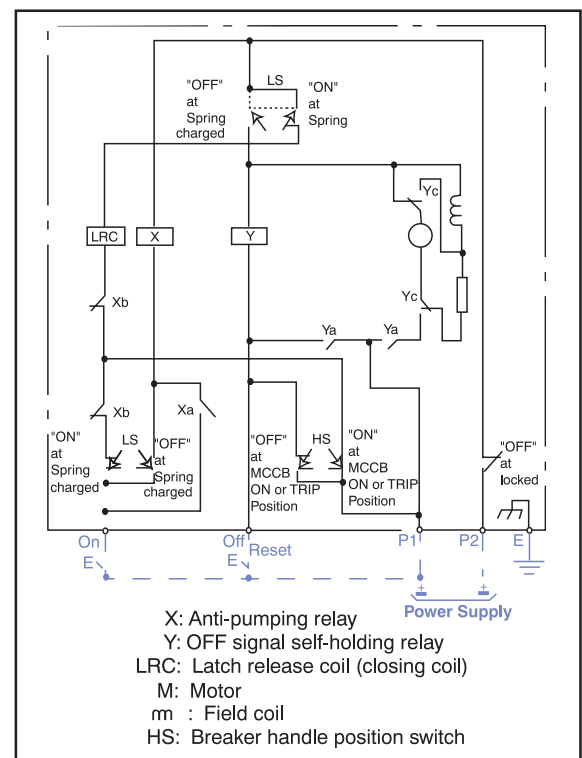

### Automatic Reset

An alarm switch (a-contact) fitted in the breaker, can be used to induce recharging of the closing spring and automatically reset the MCCB. Connect the automatic reset circuit as shown below.

If the alarm switch is used, a pulse signal will be produced in the automatic reset circuit when the alarm is activated. Be sure to use a self-hold circuit to avoid possible problems caused by this pulse signal.

It is recommended that a time delay of approximately 3 minutes is introduced to the automatic reset circuit for thermal magnetic MCCB's. In the event of an overload trip this will prevent the motor operator repeatedly driving the MCCB between the tripped and reset positions while the thermal element is hot.

If an alarm signal is also required for external control, use a 2 alarm switch combination.

Note: Customer wiring shown in blue

# External accessories

## Operating handles & LOCKING DEVICES

ETIBREAK 2 handles are extremely reliable, having been designed to endure the same switching duty as the host MCCB. It is easy to fit the operating unit to the MCCB. Fitting involves three easy steps:

1. Align breaker toggle with operating mechanism
2. Push handle into position (the handle's round pegs locate securely in the breaker's round holes and the handle's\* square pegs in the breaker's square holes).
3. Twist locking screws through 45 degrees.\*

MCCB ON

MCCB ON

### Safety Features

- Door interlock mechanism with override facility included as standard
- IP55 as standard (door mounted version), IP3X as standard (breaker mounted version)
- IP65 optional, IP5X optional
- Locks OFF with up to 3 padlocks (8mm hasps)
- Optional keylock in OFF position
- Available grey handle with black base or red handle with yellow base
- A trip test can be performed with the external operating handle fitted to the MCCB

### Cubicle Door Cutouts

Using Etibreak 2 Operating Handles

Using other MCCB Operating Handles

### Orientation

To switch the breaker from OFF to ON the handle is rotated through 90 degrees in a clockwise direction. The ON (I) and OFF (O) indication of the handle can be re-oriented in steps of 90 degrees with respect to the operating mechanism. This allows the indication position to remain the same whether the breaker is mounted vertically (right side up or upside down) or horizontally (on its left side or on its right side). The hole cut-out dimensions for a panel or door will remain unchanged if the handle is re-oriented. The handle's axis of rotation is on the intersection of the centre lines of a 3P MCCB. This means that the positioning of the door cutouts is symmetrical for breakers mounted horizontally on either side of a vertical busbar system.

# External accessories

## Operating handles & LOCKING DEVICES

**Door Mounted Handle**

The door mounted operating handle is used to operate a circuit breaker mounted inside a cubicle from outside the door and complies with IEC 60204-1. It consists of an operating mechanism that is mounted on the breaker, an operating handle that is mounted on the door, and a shaft that transmits the turning force from the handle to the operating unit. The shaft can be cut to the required length. The shaft support makes easy to insert to the operating handle when the panel door is being closed.

### Door Interlock Mechanism

The external operating handle keeps the panel door locked when in the ON position.

#### OFF open type

The handle is turned to the OFF position to open the panel door.

- Door interlock release button

The release button enables the panel door to be opened with the handle in the ON position.

To release: push the release button on the side of the operating handle with a flat-bladed screwdriver.

### Handle Lock Mechanism

- Padlock (Standard)

This mechanism allows the breaker to be padlocked in the OFF position. Padlocks are not supplied. Up to three padlocks can be installed.

# External accessories

## Operating handles & locking devices

Breaker Mounted Handle Padlocked in the OFF Position

### Breaker Mounted Handle

This handle is used to operate a circuit breaker mounted just behind a compartment door with the door closed. The operating unit and the handle itself are mounted directly onto the circuit breaker. The handle protrudes through a cutout in the door. A moulded door flange is supplied with the handle which covers the cutout from the front.

Padlocking and keylocking is possible in the OFF position or both the ON and OFF position depending on the mounting direction.

S250 Locked OFF

S400 Locked OFF

### Locking Devices

Toggle locking devices allow MCCBs to be locked ON or OFF using up to three padlocks. Locking devices for 125A, 160A and 250A frame models accept padlocks with 5mm hasp diameter. Locking devices for 400A and 630A frame models accept padlocks with 8mm hasp diameter.

Fittings for Castell and Fortress locks are available. They are suitable for use on toggle-operated MCCBs, or on door mounted handles for MCCBs.

### Etibreak 2 Door Flange

Door Flanges are available for MCCBs up to 1000A. Door flanges are recommended to be used to cover the cut-out of a switchboard panel. Two types of door flanges are available, one for MCCB with motor operator fitted, and one style without.

# External accessories

## Terminal Covers up to 1250A

Terminal covers are used to prevent direct contact with live MCCB terminations. They also provide additional insulation to reduce the possibility of a short circuit between phases or to earth when large conductors are used.

### General features

- Terminal covers for 125A to 630A frame models require no tools for installation
- Terminal covers for 800A to 1250A are fixed using self-tapping screws.
- All terminal covers have an IP20 ingress protection rating
- **Terminal covers are ordered individually.** Two terminal covers are required to cover both the line and load terminals of an MCCB. Each cover can either be fitted to the top or bottom of the MCCB
- Terminal covers have an instrument probe access hole of 4mm diameter on each phase.

Terminal Cover Lock with Lead Seal

### Options

- A terminal cover for 125A to 630A frame models include facility for an anti-tampering seal to be added.

# External accessories

## Terminal Covers for Front Connection

Terminal covers for front connection are suitable for covering the exposed live parts of conductors terminated on the MCCB.

Terminal Covers for Front Connection

Flush Terminal Covers

### Flush Terminal Covers

Flush terminal covers are available for 125A to 630A frame models and are useful for increasing the ingress protection rating at the terminals without increasing the overall length. They can be used with busbar and for direct entry of stranded cable (with solderless cable clamp terminals).

Flush terminal covers are identical to rear terminal covers for 400A and 630A frame model.

The user can remove a section of the rear terminal cover using a tool to allow entry of the conductor.

Terminal Covers for Rear Connection

### Terminal covers for Rear Connection

Terminal covers for rear connection are available for 125A to 1000A frame model and may be used on MCCBs fitted with rear connections or plug-in connections. They prevent access to the terminals from the front and top.

# External accessories

## Interpole Barriers (BA)

MCCB Fitted with Interpole Barriers on Both Ends

Interpole Barriers between Adjacent MCCBs

Interpole barriers provide maximum insulation between phases at the terminals of the MCCB. They cannot be fitted at the same time as any of the terminal covers.

Interpole barriers for use on one end of the MCCB are supplied as standard. Additional interpole barriers can be ordered individually. All interpole barriers can easily be fitted to either end of an MCCB. MCCB moulds have been designed to accept an additional interpole barrier between two adjacent MCCBs.

# External accessories

## Accessories for Dual Supply Changeover Systems

Where more than one AC voltage source is available to a distribution system it is often necessary to prevent multiple sources supplying the system at one time. Interlocking accessories are used together with two MCCBs to prevent both being in the ON state simultaneously. This provides a secure mechanical means of preventing the connection of two supply sources.

An automatic changeover controller can monitor the status of two supplies and control the switching of two MCCBs according to pre-programmed parameters. When an automatic changeover controller is interfaced to a pair of interlocked MCCBs fitted with remote control accessories, a secure, fully automatic changeover system is achieved.

Link Interlock

### Link Interlock (ML)

Link interlocks are available for 125A to 1000A frame models and consist of a mechanism mounted to each MCCB in an adjacently mounted pair. The link between each mechanism inhibits the closure of one MCCB unless the other is in the OFF position. Link interlocks can be used on a mixture of 3 and 4 pole breakers of the same frame size. The ETIBREAK 2 link interlock is an innovative design breakthrough which will save space, time and money for switchboard builders in that:

- Installation is extremely simple. Link interlocks are field-installable and only require a screwdriver to fit.
- Link interlocks replace the accessory cover on the front of the breaker
- Motor operators and operating handles are compatible with link interlocks
- The interlock is installed on the front of the MCCB and does not therefore interfere with copperwork or cables
- No need to buy factory-built backplates with MCCBs and interlocks pre-fitted
- An automatic changeover pair consisting of an interlocked pair of MCCBs with internal control accessories and motor operators can be assembled in a few minutes!

Changeover Pair with Link Interlock and Motor Operators

Viewed from Below

# External accessories

## Accessories for Dual Supply Changeover Systems

An important safety feature is that the interlocks do not allow a control system to close a second power supply on to a fault. If a breaker has tripped its partner is mechanically prevented from closing.

This differs from other interlocks you may be familiar with, which allow a breaker to be closed while its partner is in the tripped position.

Front link-type and wire-type interlocks operate according to the following table:

STATUS OF MCCB 1	STATUS OF MCCB 2	VALIDITY OF COMBINATION
ON	ON	NOT ALLOWED
ON	TRIP	NOT ALLOWED
TRIP	ON	NOT ALLOWED
TRIP	TRIP	NOT ALLOWED
OFF	OFF	ALLOWED
ON	OFF	ALLOWED
OFF	ON	ALLOWED
TRIP	OFF	ALLOWED
OFF	TRIP	ALLOWED

The electrical control system of an automatic changeover scheme which uses these interlocks should not attempt to switch the MCCBs to a combination indicated as "NOT ALLOWED" in the above table otherwise damage to the motor operations will occur.

# External accessories

## Accessories for Dual Supply Changeover Systems

### Wire Interlock (MW)

Wire interlocks for 125A to 1000A frame models consist of two mechanisms connected by a cable. The mechanisms are mounted on two MCCBs located at a distance from each other which is limited by the length and bend radius of the cable. The mechanisms and cable inhibit the closure of one MCCB unless the other is in the OFF position. Each mechanism is ordered separately. Cables of 1.0m or 1.5m length are also ordered as separate items.

Wire interlocks can be used on a mixture of 3 and 4 pole MCCBs of different frame sizes. This allows potential cost savings by using lower rated MCCBs for the alternative power supply. MCCBs can be mounted in different switchboard compartment or on different planes.

Changeover Pair with Wire Interlock and Motor Operators

View from above

The ETIBREAK 2 wire interlock is an innovative design breakthrough which will save space, time and money for switchboard builders in that:

- Installation is extremely simple. Wire interlocks are field-installable.
- Wire interlocks replace the accessory cover on the front of the breaker
- Motor operators and operating handles are compatible with wire interlocks
- Interlocking of MCCBs mounted in different compartments is possible
- No need to buy factory-built backplates with MCCBs and interlocks pre-fitted
- An automatic changeover pair consisting of an interlocked pair of MCCBs with internal control accessories and motor operators can be assembled in a few minutes!

# External accessories

## Accessories for Dual Supply Changeover Systems

An important safety feature is that the interlocks do not allow a control system to close a second power supply on to a fault. If a breaker has tripped its partner is mechanically prevented from closing. This differs from other interlocks you may be familiar with, which allow a breaker to be closed while its partner is in the tripped position.

Front link-type and wire-type interlocks operate according to the following table:

STATUS OF MCCB 1	STATUS OF MCCB 2	VALIDITY OF COMBINATION
ON	ON	NOT ALLOWED
ON	TRIP	NOT ALLOWED
TRIP	ON	NOT ALLOWED
TRIP	TRIP	NOT ALLOWED
OFF	OFF	ALLOWED
ON	OFF	ALLOWED
OFF	ON	ALLOWED
TRIP	OFF	ALLOWED
OFF	TRIP	ALLOWED

The electrical control system of an automatic changeover scheme which uses these interlocks should not attempt to switch the MCCBs to a combination indicated as "NOT ALLOWED" in the above table otherwise damage to the motor operations will occur.

Slide Interlock Installed Between two MCCBs

### Slide Interlock (MS)

Slide interlocks are manually operated toggle locking devices which can be installed between two adjacent MCCBs (no possibility of motor operator mounting). Depending on the position of the slide, one or other of the MCCBs on either side of a slide interlock is inhibited from being in the ON position. Slide interlocks can be used between MCCBs of the same number of poles and of the same frame size. Slide interlocks can be installed in the field and are padlockable in both positions.

# Installation

## Connection and Mounting Options and Accessories

Optional 45mm Cutout Patterns

Etibreak 2 MCCBs connection and mounting accessories facilitate easy installation in any arrangement. Breakers and accessories are easy to fit. They are designed to provide safe and secure termination and mounting points. 125A and 160A/250A frame models have a choice of 45mm front cutout patterns

Overview of Connection and Mounting Accessories

Note that one set of mounting screws is supplied as standard with every circuit breaker or switch disconnector purchased.

# Installation

## Plug-in Mounting

The plug in mounting system allows fast replacement of the MCCB body without the need to disturb the terminations. Solid conductors or cables terminated with compression terminals can be used.

### Plug-In Safety Lock

The plug-in MCCB body is automatically locked to the base when the contacts are closed (toggle ON). It cannot be removed unless the contacts are in the isolated position (toggle OFF or TRIPPED). This system ensures safe removal of the MCCB from the base. Plug-in safety lock is available from 125A to 800A frame models.

Plug-in MCCB and base

Plug-in connections and safety lock are fitted to the back of the MCCB

The connection bars for plug-in bases are optional and can be configured in the field either for front or rear access. The illustrations below show possible mounting and connection options for plug in bases. These mounting and connection options are available from 125A to 800A frame models.

1. Mounted on base plate with connection bars mounted for front access. Insulation plates are supplied as standard and must be fitted.

2. Terminations in separate compartment. Connection bars are mounted for top access at the top and rear access at the bottom.

3. Mounted on angle bars. Connection bars are mounted for rear access.

# Installation

## Connection of Busbars and Terminated Cables

This connection method is standard for all front connected MCCB models. Solid conductors or cables terminated with crimp lug terminals can be used.

### Serrated Terminal Surface

Each terminal on 160A and 250A models has a serrated surface. This provides excellent grip for heavy cables terminated with crimp lug terminals, thereby preventing sideways rotation of the lug.

Maximum Dimensions of Compression Terminals			
Frame Size (A)	125	160 & 250	400 & 630
Width, W (mm)	17	25	25
Diameter, d (mm)	9	9	11
Maximum from centre to tip, e(mm)	8.5	10	12

### Connection of Large Conductors and Multiple Conductors

Flat bars are terminal extensions which can be fitted to line or load side terminals and are used to connect large conductors and multiple conductors. Available for field fitting in sets of 3 or 4 bars.

# Installation

## Direct Entry of Stranded Cable

Solderless clamp terminals can be used to secure stranded cable directly to the MCCB. Available for field fitting in sets of 3 or 4.

MCCB Model	Cable Capacity (mm <sup>2</sup> )
125AF	1.5 to 50 (1 cable)
160 and 250 AF	35 to 120 (1 cable)
400 and 630 AF	80 to 240 (1 cable)
	60 to 120 (2 cables)

## Termination in Separate Compartment

Rear connections allow termination of conductors in different switchboard compartment to the MCCB body.

The stud can be rotated in steps of 45 degrees on 125A to 630A frame MCCBs in the field.

# Installation

## Mounting on 35mm DIN Rail

The DIN rail adaptor is easily fitted to the rear of 3 pole EB2 125A and 250A models to allow clip mounting of the MCCB to 35mm DIN rail. The 45mm cutout of Etibreak 2 devices makes them suitable for mounting alongside modular devices in distribution boards.

## Insulation Distances

The insulation distances between the MCCB and earthed metal parts and insulators shown in this section must be maintained to prevent arcing faults occurring due to conductive ionised gas. In cases where other specifications require different insulation distances to those shown here, the greater distance must be maintained. In cases where two different models are installed one above the other, the insulation distance between the two models should be as for the lower model.

### ATTENTION

Exposed conductors must be insulated up to the breaker terminals. Interpole barriers or optional terminal covers are recommended. If optional terminal covers are used, insulate the exposed conductor until it overlaps the terminal cover.

# Installation

1. Insulation plate
2. Top plate (earthed metal)
3. Interpole barrier
4. Front-connected type
5. Front-connected type with extension bar
6. Rear-connected type, plug-in type
7. Side panel
8. A. Distance from lower breaker to exposed live part of upper breaker terminal (front-connected type) or distance from lower breaker to end face of upper breaker (rear-connected type or plug-in type)  
 B1. Distance from end face of breaker to top plate  
 B2. Distance from end face of breaker to insulation plate  
 C. Gap between breakers  
 D. Distance from side of breaker to side panel (earthed metal)  
 E. Dimensions of insulation over exposed conductors

# Installation

## Mounting Angle

ETIBREAK 2 MCCBs may be mounted at any angle without affecting performance.

Mounting angle does not affect performance.

## Direction of Power Supply

Power can be supplied through ETIBREAK 2 MCCBs in either direction without loss of performance.

# Installation

## Standard Installation Environment and Special Treatments

ETIBREAK 2 MCCBs are intended for installation in the following conditions as standard:

- Operating ambient temperature -10°C to 50°C.
- Relative humidity of up to 85%.
- Altitude up to 2000m.
- Atmospheres free from dust, smoke, corrosive gases, inflammable gases, moisture and salt.

For installation in conditions more onerous than those described above, contact ETI for details.

The following special treatments have been developed for installation in specific environmental conditions:

### Low temperature treatment.

For installation at temperatures down to -40°C for storage and -20°C for operation. The environment must be free from rapid changes in temperature that result in the formation of condensation

### Fungus-moisture proofing.

For installation at temperatures up to 65°C and relative humidity of up to 95%. The environment must be free from rapid changes in temperature.

### Anti-corrosion treatment.

MCCB is surface treated to increase resistance to corrosion. If the MCCB is to be installed in atmosphere that contains excessive volumes of corrosive gases or moisture, it should be housed in an airtight enclosure.

# Installation

Note (1) Supplied with terminal bars fitted as standard. Temperature ratings are not valid if the terminal bars are removed

## Selectivity

### WHAT IS selectivity?

Discrimination, also called selectivity, is the co-ordination of protective devices such that a fault is cleared by the protective device installed immediately upstream of the fault, and by that device alone.

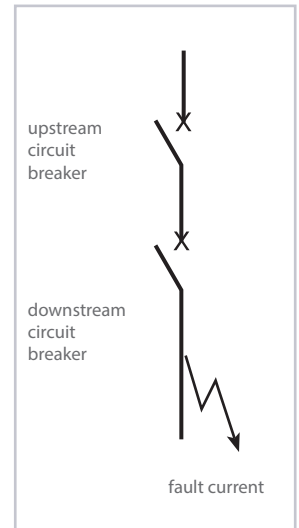

#### Total selectivity

Selectivity is said to be total if the downstream circuit breaker opens and the upstream circuit breaker remains closed. This ensures maximum availability of the system.

#### Partial selectivity

Selectivity is partial if the above condition is not fulfilled up to the prospective short-circuit current, but to a lesser value, termed the selectivity limit current ( $I_s$ ).

Above this value both circuit breakers could open, resulting in loss of selectivity.

## How to read the selectivity tables

Boxes containing the letter "T" indicate total selectivity between the relevant upstream and downstream circuit-breakers. Total selectivity applies for all fault levels up to the breaking capacity of the upstream or the downstream circuit breaker, whichever is the lesser. For the other boxes, selectivity is either partial or there is no selectivity.

If selectivity is partial then the value of the selectivity limit current,  $I_s$ , is shown in the box.

#### Worked Examples

Q (1) A Sub distribution board requires a 630A MCCB feeding a 250A MCCB. The fault level is 65kA. What combination of protective devices would provide total selectivity?

A (1) Using a ETIBREAK 2 S630 MCCB feeding a ETIBREAK 2 S250 would provide total selectivity up to 65kA.

Q (2) A final distribution board contains a 125A MCCB incomer feeding a 32A Type B MCB. Is discrimination between these devices possible?

A (3) A ETIBREAK 2 MCCB type S160/125A feeding a ETIMAT 32A type B MCB would provide total selectivity.

Alternatively ANY OTHER MCB can be used provided it has energy limiting ability of class 3 in accordance with EN 60898.

## Cascade

### WHAT IS Cascading?

Cascading is a technique where the current limiting capability of upstream circuit breakers is used to permit the installation of lower rated and therefore lower cost circuit breakers downstream.

The upstream ETIBREAKK 2 circuit breaker acts as a resistance against short-circuit currents. With this assistance, downstream circuit breakers with breaking capacities lower than the prospective short-circuit at their point of installation can interrupt the reduced short-circuit current.

Since the current is limited downstream of the limiting circuit breaker, cascading applies to all switchgear in the downstream circuit. It is not restricted to two consecutive devices.

Cascading is recognised by the following standards related to electrical installations:

IEC 60364

BS 7671

AS/NZS 3000

### The Advantages

Installation of a single limiting circuit-breaker results in considerable simplifications and savings for the entire downstream installation:

- Simplification of selection of devices using the cascading tables
- Savings on downstream devices. Cascading allows circuit-breakers with lower ratings to be used.

In addition the application of cascading will reduce both electrodynamic and thermal stress within the installation.

### How to Read the Cascade Tables

The value shown in the table is the increased breaking capacity, expressed in kA, that can be achieved if the downstream MCCB is backed up by the appropriate upstream MCCB.

## ||||| ■■■■■ MCCBs IN DC SYSTEMS

ETI's MCCBs provide an excellent range of protection for DC installations.

### Protection Method

Current transformers require alternating current to generate magnetic flux thereby inducing current to flow in the secondary winding. Any device which relies on current transformers for measurement or detection of current is therefore unsuitable for protection of DC systems. Most electronic MCCBs fall into this category.

The most common method of detecting DC overloads is by the use of a thermal element. Short-circuit protection in DC circuits is provided by electromagnetic tripping elements.

### Tripping Characteristics

The time-current characteristics of a thermal element, such as those published in Section 3, are unaffected by the frequency of current applied. They hold good for both AC and DC currents.

A magnetic element operates on the instantaneous value of the current waveform. This means that in practice in an AC circuit, it will operate at the peak value of the sinusoidal waveform. Tripping characteristics are published in AC root mean square (rms) Amperes (A). This means that the value of AC instantaneous current,  $I_p$ , which will operate the element is equal to the rms current multiplied by  $\sqrt{2}$ . Similarly, the value of DC instantaneous current which will operate the element is equal to the AC rms current multiplied by  $\sqrt{2}$ .

DC operating current of magnetic element =  $\sqrt{2}$  x AC rms operating current of magnetic element.

### Time Constant

Time constants associated with DC circuits prevent the voltage of the circuit from reacting immediately when a load current is suddenly interrupted.

The time constant,  $\tau$ , of a circuit indicates how quickly voltage across capacitors and current through inductors react to transient conditions.

The time constant of a capacitive circuit is the product of capacitance and resistance:

$$\tau = RC \text{ (s)}$$

The time constant of an inductive circuit is given by:

$$\tau = L/R \text{ (s)}$$

## Time Constant

Transient voltages and currents, including those produced by switching, do not approximate their steady state values until 5 time constants have elapsed.

Fault currents occurring in circuits with high time constants are extremely difficult to interrupt due to the lagging voltage. All DC breaking capacities in this section are shown with the assumption that the time constant of the circuit is restricted to the values shown below.

Fault Level	$\tau$
Near the rated current, $I_n$ , of the circuit breaker	<2.0 ms
<2.5 x $I_n$	<2.5 ms
<10kA	<7 ms
>10kA	<15 ms

# Dimensions

## MCCB's dimensions

**IZ** – Interpole barrier. Installed between MCCB terminal, which increases the distance between poles to reduce the possibility of creepage.

**PRS** – Terminal cover. The terminal covers are applied to the MCCB to prevent accidental contact with live parts and thereby protection against direct contact.

**PRS-ZB** – Terminal cover for att. Busbar. The terminal covers are applied to the MCCB to prevent accidental contact with live parts and thereby protection against direct contact. The width is different because of attach busbar.

**SP** – Solderless terminal

**RO** – Operating handle, breaker mounted. It's used when MCCB is installed in control centre/ switchboard

**RO\_P** – Operating handle, panel mounted, variable depth. This consists of an operating mechanism mounted on the breaker, an operating handle mounted on the panel door and a square shaft to connect the mechanism with the handle.

**MO** – Motor operator. Enabling to switch MCCB ON or OFF remotely.

**PR** – Door flange. Accessory for mounting on panel door.

**ZA** – Handle lock. Enables the MCCB to be padlocked in neither the ON or OFF position.

**ZB** – Attach busbar. Used for easier installation on busbar systems (widen terminals).

**PRO** – Handle extension. Used for easier manipulation ON/OFF at bigger MCCB's.

## Terminal Covers

### Terminal covers for Front connected MCCB's

**Plug-in mounted version**  
This version can be mounted simply by being plugged in the breaker body.

**Screw-mounted version**  
The terminal covers for 630 to 1000AF are mounted to the breakers using tapping screws. The terminal cover for 1250AF is mounted using insert nuts on the breaker cover using screws. The insert nuts do not come standard with the breaker. Please be sure to state "with terminal cover (CF)" when ordering the breaker.

## Terminal Covers
